No PSRBs have been recorded

What the Course Involves	Details of the modules contained in each semester can be seen further in this document. Regarding the course structure: Full Time Students For September entry, the sequence of modules will be: Semester 1 (taken in September), Semester 2 (taken in January), Semester 3 (project, taken in May). For January entry, the sequence of modules will be: Semester 2 (taken in January), Semester 1 (taken in September), Semester 3 (project, taken in January). Part Time Students
--------------------------	--

	For September entry, the sequence of modules will be: Semester 1 (taken in September), Semester 2 (taken in January), Semester 3 (taken in September), Semester 4 (taken in January), Semester 5 (project, taken in May and spanning 2 semesters). For January entry, the sequence of modules will be: Semester 1 (taken in January), Semester 3 (taken in September), Semester 2 (taken in January), Semester 4 (taken in September), Semester 5 (project, taken in January and spanning 2 semesters). Note certain modules need to be done in a certain sequence, and will therefore run in each semester.
Course Collaborations	
No collaborations listed	
Introduction to the Course	The MSc/PgDip/PgCert Games Design and Development is a specialist Masters course, designed to equip graduates from disciplines with significant Computing, Digital Media, Art and Design, or Interactive Technologies content with expert knowledge of state of the art tools, techniques, and theories in game design, gameplay development, real time interactive systems, immersive technologies, and creative production workflows. It is also designed to provide a foundation of research skills to support students in becoming independent, reflective practitioners, with a particular focus on contemporary developments within the games, immersive media, and interactive entertainment sectors. Consideration of ethical, cultural, and accessibility issues pertaining to game design and digital content creation is embedded throughout the course, equipping students with the necessary skills to make informed judgements around responsible and inclusive design. The MSc Project module is of particular value to employers as evidence of the student's ability to produce welldocumented, highquality, creative and technically sound work that demonstrates advanced design, implementation, and presentation skills. The project showcases the student's capacity to work autonomously, manage complex workflows, and deliver a polished interactive artefact to a professional standard within a defined timeframe. At all stages of study, the course content is complemented by studio based practical work, intended not only to reinforce the learning process but also to enhance the vocational relevance of the course. The syllabus incorporates modules designed to develop both technical and professional skills required to design, develop, and evaluate innovative game based and immersive interactive experiences. This hands on learning is further reinforced through the use of industry standard game engines, asset pipelines, and collaborative production tools that are embedded throughout the course as aids to both teaching and learning. Students will engage with their learning using the University's Virtual Learning Environment (VLE). They will experience a variety of learning methods such as synchronous and asynchronous lectures, tutorials, studio sessions, critique workshops, and study groups, as well as engaging in forums for discussion and debate. These varied learning opportunities help to build a collaborative creative community, reflective of contemporary games and digital media industries. The MSc Games Design and Development course is designed to foster the development of individuals into evidence based, critical thinkers, capable of reflective practice within creative and technical roles. It aims to enhance the acquisition of knowledge, skills, and behaviours that are essential for their prospective employers across the games, immersive media, simulation, and digital creative sectors. The course curriculum is shaped by relevant local, national, and international strategies, industry practices, and academic research, ensuring that the content is both current and globally relevant. The main themes across the course include critical thinking and writing, research and critical appraisal, iterative design, technical development, playercentred evaluation, focused project work, and subjectspecific modules that integrate theory with handson practice. This alignment enhances the relevance of learning and supports the application of theory to realworld creative and professional scenarios.

	Furthermore, the Dennis Law RGUplus Award (https://www.rgu.ac.uk/the-denis-law-rguplus-award) offers opportunities that empower students to adopt a global perspective, thereby enhancing their employability and providing the skills and experiences required to excel after graduation. This represents a collective offering of opportunities, experiences, and learning grounded in the pillars of Sustainability, Entrepreneurial Mindset, and Learning Beyond the Classroom. Module assessments range from design portfolios, prototype artefacts, written analyses, technical documentation, and creative assessments, depending on the module. Formative assessment plays an essential role in all modules, with activities constructively aligned with final assessments and designed to support students' progression. RGU's commitment to sustainability recognises that every course contributes to the UN Sustainable Development Goals, particularly SDG 4 (Quality Education) and SDG 12 (Responsible Consumption and Production), through the cultural, societal, and environmental impacts of digital media and interactive technologies. Course content integrates sustainability themes relevant to games and digital design, such as inclusive design, ethical representation, cultural sensitivity, and responsible production practices. Additionally, the principles of selfassessment, skills development, and intentional career planning form a crucial foundation to ensure that graduates can maximise opportunities for future global employability.
Educational Aims of the Course	The specific aims for each stage of the course are: Postgraduate Certificate To produce practitioners who will be able to: • Appraise core principles of game design, gameplay theory, and player experience. • Construct functional game prototypes using industry standard game engines and foundational development workflows. • Take responsibility for identifying initiatives, sourcing and evaluating research relevant to Game practices and in applying this research to inform creative and technical decisionmaking. Postgraduate Diploma To produce practitioners who, in addition to the above, will be able to: • Appraise advanced design, technical, and collaborative production methods. • Evaluate professional, ethical, and inclusive considerations in game development. • Appraise stateoftheart developments in immersive technologies and interactive media. • Evaluate the societal, cultural, and accessibility implications of game design across multiple platforms and player contexts. • Construct advanced game components integrating immersive technology, interaction design, or complex gameplay systems. Master of Science To produce practitioners who, in addition to the above, will be able to: • Appraise the creative, technical, and production requirements of a substantial game design and development project. • Analyse multiple approaches to designing and implementing a complete, polished game or interactive immersive experience. • Take responsibility for leading and managing a major independent game project from concept to completion. • Construct a final solution that integrates sophisticated game levels, technical systems, immersive elements, or novel interaction mechanics. • Appraise the effectiveness, innovation, and user impact of a complex game artefact through reflective evaluation. • Take responsibility for producing professional written documentation and presenting project outcomes to an intended audience.

Awarding Institution	Robert Gordon University
Course Duration	On-Campus Full-Time Students Full-time 12 months with a September intake Full-time 16 months with a January intake On-Campus Part-Time Students Part-time 28 months with a September intake Part-time 32 months with a January intake Online Learning Full-Time Students Full-time 12 months with a September intake Full-time 16 months with a January intake Online Learning Part-Time Students Part-time 28 months with a September intake Part-time 32 months with a January intake Depending on their mode of study, students can choose to undertake either a short-term (3 months) or long-term (12 months) placement. All placements require approval from the School prior to commencement. If a student goes on placement, the duration of the course will be extended by the duration of the placement.
Distinctive Features of the Course	The course offers specialist advanced technical and creative skills in areas of Games, such as design, development pipelines, prototyping and production. All subjects align with the School's strong research practice in games, interactive media, simulation, digital creativity, and immersive technologies, meaning students will benefit from being taught by academics who are active researchers and practitioners in these areas. The course draws on established industry and research collaborations within the games, creative, and cultural sectors, including work with RGU's Digital Innovation Lab, heritage and public engagement partners, and regional games studios, supporting industry informed teaching and impact focused digital innovation. Throughout the course, students will be required to embed and embrace emerging technologies and responsible design from all angles. This includes core theoretical understanding, innovative real world applications, ethical and professional considerations, towards achieving the course aims and objectives.
	Students may elect to undertake a short placement or a year-long placement. The placement provides an opportunity to sample working life, be it in commerce, industry or the public sector, and apply knowledge and skills learned in the classroom to the challenges of the workplace. Students who have completed the placement as part of their course have a definite advantage when it comes to applying for graduate positions. With the combination of training, experience, and a successful degree, students are often offered subsequent employment by the placement provider with which they undertook their placement. While the student is on placement, they will be responsible to a designated member of the placement provider (the Industrial Supervisor) for the discharge of their day-to-day duties.

Placement/Professional Experience	Each student on placement is also assigned an Academic Tutor from the staff of the School, who the student can contact about any academic or non-academic problems during the placement. The Academic Tutor will hold a small number of scheduled video calls with the student and their Industrial Supervisor during the placement. Students may choose to undertake a short placement. This normally comprises 3 months of continuous, full-time supervised work experience. The assessment for a short placement experience is based on a review of the student's work-related skills, conducted by the Industrial Supervisor. Students on a short placement will normally receive at least 1 video call with their Academic Tutor. As an alternative, students may undertake a year-long placement. The year-long industrial placement normally comprises of 12 months of continuous, full-time supervised work experience. The assessment for a year-long placement is based on a review of the student's work-related skills, conducted by both the student and their Industrial Supervisor. Students on a year-long placement will normally receive at least 2 video calls with their Academic Tutor. Placements must be undertaken after the completion of all taught modules and begin before the start of the final project. A student may choose to either undertake a placement at the same time as their final project or delay the start of their final project until the placement has finished. The Course Leader must approve this decision. The University provides support to students interested in undertaking a placement through the Placement Office and Centre for Employability and Community Engagement. The Placement Office maintains a pool of placement opportunities and establishes contact with new placement providers as necessary. It will normally assist students by informing them of suitable placement opportunities. Students are also given help and guidance by the Placement Office in obtaining their own placement from those advertised directly by companies or through their own connections. The Centre for Employability and Community Engagement offers further support for students, including with preparing their CV and developing interview skills. All placements require approval from the School prior to commencement, in order to ensure that they are suitable for the student and to confirm that the placement provider has put adequate supervisory and health-and-safety arrangements in place. Placements cannot be guaranteed and students wishing to undertake a placement are expected to reasonably engage with the process, for example by providing a copy of their CV to the Placement Office and by attending any interviews with potential placement providers when required. The credits awarded for the placement module are in addition to the 180 credits achievable from the other modules. Successful completion is not required for progression or graduation. The credits achieved for placement may not be used to compensate for any credits from the other modules.
Opportunities for Further Study	The course has a strong grounding in research techniques and enables students to advance into research and development at doctoral level within this institution or other UK higher education institutions.
	Modules have been designed in alignment with SCQF credit requirements, ensuring appropriate scope, workload, and level of learning outcomes while the structure and content of the course has also been designed with the British Computer Society's (BCS) requirements for Practical/Engineering Applications in mind, and embedded in the core structure are modules and topics which provide the student with computing skills and knowledge in Underlying Theory, Design and Methodology, Tools and Techniques and Project Management and Group work. Standards are primarily established through QAA (Quality Assurance Agency) Benchmarks and the requirements imposed by the British Computer Society in order to gain professional course recognition. The achievement of appropriate standards is demonstrated through the University's course validation procedures and professional institution accreditation visits. The QAA qualification descriptors and Subject Benchmark Statements provide a reference framework that has guided the evolution of the School's programme, and the extent of the subject discipline, as defined by QAA, is broadly matched by the provision that now exists within the School's courses.

External and Internal Indicators of Quality and Standards	A number of internal processes and procedures are used by the School to ensure that standards are maintained and enhanced. Stakeholders' views on standards are routinely obtained from the Staff/Student Liaison Committee, Programme Management Teams, Student Experience questionnaires, Industrial Board, industrial visits to placement students, staff involvement in professional body activities and staff participation in accreditation events outside the School and at other HE institutions. In addition to this, best practice in teaching and learning within the University is monitored through the University quality enhancement and quality assurance processes. These include the regular five-yearly cycle of Institution-Led Subject Reviews, as well as participation in the University quality assurance committee structures, such as the University's Student Experience, and Academic Regulations Sub-Committees. Finally, it should be mentioned that several academics within the School serve as external examiners at other institutions contributing to advancement of pedagogical research and a commitment to expanding the scholarship of computing science education. Academic staff help to organise, and participate in, national and international conferences and have been awarded funding from the Higher Education Academy, the Scottish Informatics and Computer Science Alliance, and the Scottish Enhancement Themes to pursue work in computer science education, as well as more general work on student transitions. The School also participates in university conferences on teaching and learning.
University Academic Regulations	This course is governed by the provisions of the University's Academic Regulations, which are available at www.rgu.ac.uk/academicregulations . In particular: Regulation A1: Courses Regulation A2: Admission and Enrolment Regulation A3: Section 1: Student Appeals (Awards and Progression) Procedure Regulation A3: Section 2: Student Conduct Procedure Regulation A3: Section 3: Student Fitness to Practise Procedure Regulation A3: Section 4: Student Fitness to Study Procedure Regulation A4: Assessment and Recommendations of Assessment Boards
University Entry Requirements	Applicants must satisfy the University's general admission requirements to courses as contained in Academic Regulation A2: Admission and Enrolment, including proficiency to a minimum standard in the English language. Specific entry requirements for this course are detailed below.
Course-Specific Entry Requirements	The typical minimum entry requirements are an Honours Degree (2nd class or better) in a discipline with significant Games, Computing, Creative Technology, or Digital Media content. Applicants with a lesser qualification who possess significant industry experience or substantial relevant personal development in games design, games development, interactive media, or a related creativetech field may be considered for entry into the course.
Alternative Qualifications for Entry	Where an applicant supports an application with alternative qualifications, the School may wish to arrange an interview to discuss the level of qualification offered and the experience gained within a games, interactive media, or creativetech background.
Interview Procedures	Interviews are not normally required.

Course-Specific Regulations	The MSc project module cannot be condoned as it is key to demonstrating essential skills in the course, such as the ability to conduct a significant piece of independent work. The placement modules cannot be used to compensate for failed modules. All students, regardless of mode and start date, will typically undertake resits in the summer exam period. Exceptionally students who start in January may be offered a resit opportunity after completing two semesters, in April of the following year.
Equality, Diversity and Inclusion	The University has a strong commitment to the active promotion of equality across its functions, including its course provision. To this end the University has developed an inclusivity statement which articulates the University's desire to strive towards creating a working, learning and social atmosphere which is inclusive, harmonious and respectful of diversity. The University has also developed an Equality and Diversity Policy and every two years publishes a mainstreaming report, including equality outcomes, which explains how the university is developing and implementing its inclusivity statement. At a course level, Course Leaders monitor and comment on equalities data through the Annual Appraisal process. Through this process any significant trends in equalities data are highlighted. Further information can be found at: Equality & Diversity RGU. All Schools have a nominated School Contact who can advise on the requirements of the course and the range of course-specific reasonable adjustments that may be made. The University's Inclusion Centre provides support for students, details of which may be found at: The Inclusion Centre: Disability & Dyslexia Support & Advice Services RGU.
University Strategy	The Purpose of the University is: • To be an innovative, inclusive and professionally focused University that has a positive impact on those we serve. The Mission of the University is: • To transform people and communities by providing excellent teaching, research and enterprise opportunities to contribute to economic, social and cultural and environmental sustainability. The Culture of the University is: • To recognise and celebrate the values of curiosity, authenticity, approachability, collaboration, enterprise, ambition, respectfulness, and equality. Driven by the spirit of curiosity to continually improve, our values and principles will guide us. Our partnerships with other organisations and the communities we serve are also a mechanism to develop and grow our diversity. We have a strong commitment to widening and extending access to our courses, regardless of an individual's background. At the core of the University's significant achievements is the commitment and dedication of our people. The sense of partnership between our staff and students is strong and supporting our students to succeed in their studies and beyond is deeply ingrained in our culture. These features are reflected in the University's student satisfaction rates, which in recent years have consistently placed RGU in the top 10 of universities in the UK.

	RGU has a long history of inspiring highly employable graduates. This is achieved through close, collaborative contact with employers in the design and delivery of our curriculum; the range and breadth of accreditations with professional and statutory bodies; the significant role work placements and work-based learning play within our courses; and the embedding of enterprise across all our activity. In a changing society, we will ensure the continued evolution of our curriculum so that our graduates can continue to succeed in their ambitions and make a positive impact within society well into the future. To achieve our ambitions, our curriculum must be global in outlook, and we must maximise the international reach of our course portfolio. The University's research activities must have international impact and our enterprise activities must reflect the global reach of the economic sectors we work with and the ambitions of the region. RGU recognises that the creation of a sustainable future for all is a priority that unites us globally, and which demands expertise, creativity, and innovation from all subject areas and professional disciplines. Consequently, sustainability is integrated into all courses, equipping students with skills and competencies that are essential for their future careers and lives.
	The extent of the course syllabus demands a relatively rapid pace of delivery. Consequently, student centred learning strategies play an important role in all modules and throughout all stages, reinforcing and supplementing more traditional methods of subject delivery. Independent reading, directed research, iterative prototyping, analysis of gamedesign case studies, enginebased development tasks, and directed searches of online academic and industry resources are commonplace. The preferred learning strategy for each module depends on the nature and extent of its syllabus content, its subject specific learning outcomes, and its contribution to the overall aims of the MSc Games Design and Development. In the sections that follow, a more detailed description of the learning experience is provided, distinguishing between: • Specialist modules • Professional skills modules • Integrative studio modules Teaching and learning are reviewed through an annual appraisal mechanism, and strategies are subject to continual enhancement to reflect best practice in games education pedagogy and contemporary industry workflows. Part time students participate in the same sessions as full time students, but they typically take 30 credits per semester instead of 60 credits. Specialist Modules These modules develop specialist knowledge in game design principles, real time 3D development, prototyping, user experience, interaction design, and immersive technologies. Learning is delivered through synchronous lectures, asynchronous (recorded) sessions, demonstrations, and online tutorials, supplemented by student centred tasks. These modules reflect the School's strengths in interactive media, simulation, visualisation, gamebased learning, immersive environments, and digital creativity, and are delivered by research active or industry experienced staff. All core modules contain structured practical components designed to help students synthesise conceptual, creative, and technical skills. Exercises include: • Designing and analysing mechanics and systems • Rapid prototyping • Building realtime 3D interactive scenes • Implementing gameplay behaviour • Conducting playtesting or usability testing

Course-Specific Learning Experience

- Evaluating immersive and spatial interactions

Online support sessions complement these activities and ensure students can complete practical tasks successfully.

Professional Modules

This module provides the professional practice foundations required for postgraduate level work in the games industry and academia. It develops:

- Research and inquiry methods
- Technical and design communication
- Project planning and production management
- Critical reflection and analysis
- Understanding of legal, ethical, cultural, and accessibility issues in games

Feedback takes the form of self reflection, peer critique, and academic commentary. Through directed reading, engagement with industry case studies, and presentations by external speakers, students develop awareness of professional standards, emerging practices, and expectations within the games sector. Recorded seminars are made available to online learning where possible.

Integrative Modules

The Studio modules provide opportunities for students to integrate creative, technical, and critical skills within an applied, practice based environment, with a focus on:

- ideation
- conceptual development
- systems thinking
- prototyping
- exploring player experience
- experimentation in form, mechanics, and narrative
- production pipelines
- building more complex prototypes
- breaking, testing, and debugging
- evaluating mechanics and interactions
- conducting structured playtesting
- refining and polishing interactive experiences

Students investigate design questions, research precedents, and iterate on playable prototypes.

Studio modules prepare students directly for the extended MSc Project, enabling them to scope, plan, produce, and evaluate substantial game development work.

Research Support

Research skills are embedded across a number of modules in preparation for ongoing independent and critical thinking, as well as the final project. Together, these modules develop:

- Critical analysis skills
- Literature review techniques
- Understanding of design research and practice based methodologies
- Knowledge of emerging tools, engines, and industry trends
- Ethical, cultural, accessibility, and societal considerations

Students preparing for the MSc Project are encouraged to attend a dedicated Library Workshop, which introduces academic and industry information sources and systematic methods for reviewing literature relevant to games and interactive media.

Although not formally assessed, the Workshop supports independent research and strengthens the contextual foundations required in the MSc Project.

Group Work

Group exercises are widely used across the curriculum, particularly within the Studio modules.

These activities develop collaborative problemsolving, communication, and productionpipeline skills. Students use appropriate tools (version control, collaborative documentation, production boards, shared engine projects) to mirror contemporary gamesstudio practice.

The Learning Process: Teaching Strategy and Methods

The course curriculum is designed with an emphasis on the integration of theory, practical skills, and application, with an emphasis on a truly interdisciplinary experience and diverse skill building. It enables the student to acquire and develop the subject knowledge and understanding necessary for successful professional employment and supplies methodologies for the adoption of a disciplined approach to games design development tasks such as problem analysis, specification, critical design, implementation, and testing.

Such knowledge includes an understanding of the range of possible options for these tasks, suitable technologies and media types, the related practical and transferable skills including relevant approaches to collaborative work, access to the appropriate software tools and resources. It also provides the necessary underpinning to guide practice, to ensure the sustainability of their knowledge and to provide an appropriate framework that will accommodate rapid technological change and advancement.

The course curriculum is designed to enable the student to acquire and develop their subject knowledge and understanding, intellectual and thinking ability and practical and key transferable skills at Masters level corresponding to the Scottish Credit and Qualifications Framework. The overall philosophy and strategy for the course is to provide a sound knowledge and understanding of Games Design and Development.

The vocationally orientated nature of the course requires the student to achieve general and specific skills, which are addressed through a combination of teaching and learning methods, including studio time, lectures, lab sessions, tutorials, seminars, student centred learning and private study. For online learning students, on-line materials (some of them interactive) and on-line sessions will replace face-to-face sessions and seminar/guest lecture presentations may be streamed and/or recorded and uploaded to the Virtual Learning Environment.

The course induction programme is aimed at ensuring students gain familiarity with the (academic and non-academic) policies and procedures required for the successful completion of the course, e.g. assessment, extenuating circumstances, grading schemes, employability, student services etc.

Teaching and Learning Strategy

Students are expected to take an active role in their learning. As well as studying formally delivered materials, they are required to expand their knowledge and skills by reading related materials, and undertaking increasingly more challenging theory- and practice-based research. As the course progresses, students will be expected to self learn, work independently, critically reflect on their learning and establish their own learning objectives. Students are also expected to, where appropriate, seek help from Module Coordinators and others as appropriate.

Teaching and Learning Methods

The main goal of the teaching and learning strategy is to enable students to become critical, reflective, independent learners who are active participants in the learning process. Student involvement in the learning process ensures the development of interpersonal skills and professional attitudes as well as developing the motivation and autonomy needed to take control and regulate their own educational experiences. This means that, throughout their course of study, the student will begin to take more responsibility for their own acquisition of necessary skills and knowledge so that, by the end of their course, they will be in a position to evaluate and assess their own effectiveness.

This process is driven by various objectives such as the need for constructive alignment of syllabus and learning approaches and makes use of a wide range of appropriate delivery styles. These include conventional instructional teaching methodologies, social learning activities such as group and team-working, as well as constructivist, investigative approaches such as problem-based learning and enquiry-based learning.

As well as the day-to-day use of the latest computer hardware and software afforded by the degree, extensive use of technology-assisted learning is made within the course of study.

Examples of these include assessment by means of computer-assisted assessment packages embedded in the virtual learning environment to engage the student and increase the speed of feedback and the use of an integrated approach whereby the student has short periods of instruction followed by immediate lab exercises to contextualise the topic.

The broad nature of the programme including common and specialist elements necessitates the use of a broad range of teaching techniques. These include lectures, seminars, tutorials, computer laboratories, interactive materials, online learning supported sessions, group work and the undertaking of a large supervised project.

Teaching and Learning Approaches

Lecture

This is usually a formal discourse for the purposes of dissemination of information, the demonstration of techniques where appropriate and the discussion of supporting ideas and consequences. The lecture is supported by a network of technology assisted dissemination equipment including computer projection facilities, internet resources, media resources and whiteboards/presentation tools where appropriate. Although this type of presentation is suitable for a one-sided discourse, ample opportunity exists for questions, interaction, and discussion - and this is facilitated by technological means, e.g. using personal response systems. In many of the modules taught on this course, lecturing occurs in a more interactive format, during laboratory sessions for example, using a studio lab or language lab approach where 'bite-size' lectures with theoretical content are interspersed with practical student centred skill-based activities to embed theory in practice, encouraging deep learning.

Seminar and Tutorials

In the School, tutorials are used for a wide range of activities, each suited to the subject. They may consist of the staff supporting students engaged in problem solving or may exist as a series of group exercises where each group is encouraged to distribute responsibilities allocate people to tasks and manage workload to complete some team-based activity. Generally this type of teaching is used to support the lecture, clarify the material and experiment with the techniques and skills required.

Laboratory

The nature of Games Design and the principles, theory and practice which make up the subject, requires students to gain practical skills in the use of computer technology. Laboratory activity takes place in one of the School's computer laboratories and consists of the student, supported by staff members - practising those skills necessary in the development and

	deployment of game-based artefacts such as prototypes, and including quantifiable analysis techniques for testing activity such as playtesting. There has been increasing emphasis on using a 'language - lab' approach to subjects in which a series of short mini-lectures are delivered in labs to allow students to gain theoretical knowledge of a topic. These are interspersed with selected practical exercises, which allow this knowledge to be immediately assimilated and so reinforce the learning process. Group Projects Group projects are extended pieces of work which are usually completed under supervision of a staff member. Students are assigned to small project teams and given a requirements specification for a task which may comprise elements of analysis, design and the implementation of an interactive system, development of a piece of software, or the exploration and practical investigation into other game related activities. The students manage the project processes themselves and work as an organised team to produce a set of deliverables which usually includes a design and development component incorporating an interactive media-based artefact. In addition, they would be expected to provide accompanying documentation to a professional standard. This activity approximates closely with the development of a project undertaken by a project team within industry. Individual Project This is an extended piece of work, completed under supervision of a staff member. The student is expected to agree a requirements specification for a task, which may be the analysis and design of a system, the development of software or construction of a digital media artefact, and the production of a written project report. This activity approximates closely the development of an extended individual development task within industry. Student's Role in Learning Students are expected to be active participants in the learning process. This means that there is a requirement for students to extend their learning behaviour from reliance on formally delivered materials to wider reading, research, and self-directed enquiry. As students develop themselves over the duration of the course, there is an expectation that they become increasingly self-directed and self-motivated, taking greater control of the study process, and defining their personal objectives for learning. Students are encouraged to regularly reflect upon their learning and to establish a view of their own progress and development, which may form the basis of discussion with staff who provide guidance during tutorials. Students are expected to utilise the full range of facilities and resources available to them, for example the services and resources provided by the library.
Assessment	Assessments are module dependent, but will largely assess a student's ability to contribute meaningfully to the field of games design and development, from play testing to asset generation, programming, optimisation, audio/visual FX, cinematography, postprocessing, QA and play testing, and other core components of the game development process. A range of assessment methods are used, with particular emphasis placed on coursework assignments, including design exercises (ranging from design studies to fully implemented solutions), comparative studies, and investigative reports. Students are told in advance what assessment methods will be used for each module and will have access to examples of past assessments. Where the format of assessment varies significantly from one year to the next, examples of assessment will be created in order to ensure students understand what the assessment entails. All assessments include a marking/grading scheme which describes the criteria used for the award of marks/grades. The use of tools will be assessed in all coursework assignments (i.e. use of tools to plan, aid design, collate results and document coursework). Demonstration of IT competence is mandatory in production of documentation to support all coursework submissions. In certain assessments, students may be required to use generative AI tools (e.g. Copilot) to complete all or part of their submission. This will allow them to put into practice the technical, ethical and legal skills acquired in the course, towards effective and responsible use of AI in completing a defined task. In such assessments, considerable weighting will be placed on how the tools were used (e.g. approaches to prompt engineering) and the students' overall evaluation of the quality of the subsequent output.
	The University provides a number of means of supporting teaching and learning:

University Support for Teaching, Learning and Assessment	• student induction organised on a course or School basis; • a Team Around a Student (TAAS) system of pastoral support to students including online support www.rgu.ac.uk/policies [The TAAS School Student Support Model replaces the Personal Tutor model of student support from Session 2026-27]; • an extensive programme of student study skills delivered through Student Life and the Library; • an extensive library of learning resources; • close collaboration with industry and professional, statutory and regulatory bodies; • the University's active participation in Scotland's Tertiary Enhancement Programme (STEP) www.step.ac.uk ; • support for staff from the Department of Academic Quality and Learning Enhancement (AQLE), including credit-rated teaching, learning and assessment provision; • extensive opportunities for student placements with companies or organisations, academic overseas exchange programmes, and support for entrepreneurial activity and community engagement opportunities; • access to a range of professionally qualified, quality assured careers professionals to support individual students and graduates career planning and opportunity search, supported by a range of bespoke and contemporary online advice and information including the extensive RGU eHub; • Moodle, http://campusmoodle.rgu.ac.uk , the University's dedicated virtual learning environment; • a commitment to knowledge exchange and technology transfer through focused research activity, which contributes to the critical underpinning for all taught courses; • the expanding provision of state-of-the-art, purpose-built facilities and buildings.
Course-Specific Support for Teaching, Learning and Assessment	The School's computing facilities comprise a number of dedicated laboratories equipped with state of the art PCs. These assure high performance and support for current software technologies. Remote access to laboratory PCs is available, enabling online learning students to use these facilities off campus. The School places strong emphasis on maintaining close links with industry and on actively identifying and integrating state-of-the-art technologies into its modules. This approach underpins the academic success of students by ensuring that teaching and learning remain current, relevant, and aligned with professional practice. All students are supported through the University's established whole school support structure, which provides coordinated access to Course Leaders, Module tutors, Academic staff, Project supervisors, and the School Office team for academic guidance and general pastoral support. The Project Coordinator offers general guidance on all aspects of the project process. In addition, each student is allocated a Project Supervisor who provides detailed and subject specific advice throughout the project. Students undertaking a placement are also supported by a workplace Placement Supervisor and an Academic Tutor within the University. Moodle, the University's Virtual Learning Environment, is used to support learning in a variety of ways, including: • acting as a repository for learning materials; • hosting discussion forums; • supporting the electronic submission of coursework; • enabling electronic assessment; and • providing feedback to students.

	In addition to induction activities at the start of the programme, the School provides a focussed induction session. These sessions address topics of relevance to students, including assessment processes, research skills, student support services, academic integrity, and strategies for managing circumstances that may affect academic performance.
University Monitoring of Quality and Standards	The University employs several mechanisms for evaluating and improving the quality and standards of teaching, learning and assessment, including: • <i>Annual Course Appraisal Reports</i> are prepared for each course and reviewed and approved by Course/Programme Management Teams and School Academic Boards which consider, amongst other things, feedback generated from student questionnaires; • <i>Institution-Led Subject Review</i> , involving external panel members, on a six-yearly basis to formally review its major subject provision, followed by a three year interim review to monitor progress against actions/issues raised through the review process; • <i>External Examiner Annual Reports</i> ; • Ongoing liaison with industrial/professional liaison groups. Formal Committees with responsibility for monitoring and evaluating quality and standards: • Staff/Student Liaison Committees, or equivalent; • Course/Programme Management Teams; • School Academic Boards; • Assessment Boards; • Quality Assurance and Enhancement Committee and associated Sub-Committees.
Course-Specific Monitoring of Quality and Standards	The School of Computing, Engineering and Technology is committed to maintaining the highest standards of quality in teaching, pedagogy, and research, within an inclusive environment that values all stakeholders. Formal feedback is collected through student questionnaires, while informal feedback is gathered via focus groups and ongoing dialogue with students. Student questionnaires provide structured feedback on both the course and individual modules, enabling students to comment in detail on teaching, assessment, the learning environment, support services, and facilities. Staff Student Liaison Committees (SSLCs) provide an additional forum for discussing a wide range of course related issues, with particular emphasis on matters raised by students. Feedback and resulting actions are formally reviewed and documented through the Annual Course Appraisal process and are discussed by the Programme Management Teams. Responses to issues raised through SSLCs and other mechanisms are communicated to students as soon as is practicable. In addition, students are able to raise course or management issues directly with their Course Leader at any time, either in person or through their class representative.
	The University and RGU:Union work in partnership to create an environment which stimulates: • the participation of students, by empowering them to proactively provide views and opinions; • a supportive learning community where students and staff engage in meaningful dialogue; and

University Student Feedback Mechanisms	- the engagement of students in the design of solutions and enhancements. This approach is underpinned by the <i>Student Partnership Agreement</i> which promotes the ethos of partnership at all levels of the University. Further information can be found at the Student Representation and Partnership Moodle Area: Student Representation & Partnership RGU . There are a variety of opportunities for students to provide feedback to the University, and to become actively involved in shaping their learning experience. These opportunities are integral to the University's approach to the quality assurance and enhancement of teaching and learning, and the holistic student experience. Mechanisms through which students are engaged and supported include: - participation in student evaluation questionnaires and where relevant the <i>National Student Survey (NSS)</i> ; - staff/student liaison arrangements at course/programme level; - support for Student Representatives; - student representation on Institution-Led Subject Review Panels and Validations; - student representation on key University committees.
Course-Specific Student Feedback Mechanisms	The University uses a range of mechanisms to gather feedback from students on their learning experience. Student representation is provided through the appointment of Student Representatives for each course. These representatives act on behalf of their peers at Staff–Student Liaison Committee meetings, which are held each semester and include staff representatives from the relevant School. Student Representatives are also invited to meet with members of the School's Executive Management Team during both the first and second semesters, to discuss key topics and raise any concerns. Notes from these meetings, together with responses to issues raised, are subsequently made available to students. A single Staff Student Liaison Committee operates for all postgraduate courses within the School and meets twice per semester. The Committee includes an Associate Dean of School, Course Leaders, teaching staff, and class representatives from each course intake. It provides a forum for the exchange of information and discussion of course-related issues. While online learning students may not be able to participate in Committee meetings live, they are invited to submit issues in advance. Responses to these issues are communicated to them following the meeting.

Awards

Stage 1

Permissible Awards	Title	Location	Target Award	PSRB	Award Credits
Postgraduate Certificate - PgCert	Games Design and Development	Aberdeen, United Kingdom	Exit Award		60
Postgraduate Diploma - PgDip	Games Design and Development	Aberdeen, United Kingdom	Exit Award		120
Master of Science - MSc	Games Design and Development	Aberdeen, United Kingdom	Target Award		180

Level Learning Outcomes

On successful completion of this Course the learner will be able to :

#	Description	SCQF Characteristic	SCQF Level
LLO1	Appraise state of the art approaches to solving a broad range of problems in Games Design and Development.	SC1	SCQF 11
LLO2	Evaluate tools and techniques which aid the specification, design and implementation of a Games Design and Development project.	SC1	SCQF 11
LLO3	Make informed judgements about project management frameworks and lay down effective procedures for monitoring progress of any largescale games development or research project.	SC1	SCQF 11
LLO4	Evaluate information resources and how to access these to obtain stateoftheart knowledge of current game design principles, development tools, theories and technologies.	SC1	SCQF 11
LLO5	Synthesise comprehensive, detailed, state of the art knowledge of the specialist area(s) covered by the course within the context of the broader games and interactive media discipline within which the course is set.	SC1	SCQF 11
LLO6	Construct research methods appropriate specifically to their Masters independent study project, together with detailed knowledge of the particular game design or development area in which the project is carried out.	SC1	SCQF 11
LLO7	Analyse the theoretical and empirical limits and boundaries of games design and development, and the range of methods of study and types of judgments employed by advanced practitioners.	SC1	SCQF 11, SCQF 11
LLO8	Construct statistical methods to assess and evaluate research or experimental playtesting results.	SC2	SCQF 11, SCQF 11
LLO9	Deal with a wide range of Games Design and Development theories, tools, techniques and skills.	SC2	SCQF 11
LLO10	Produce highquality coursework in the PgCert/PgDip modules through effective use of available game development tools and production pipelines.	SC2	SCQF 11
LLO11	Take responsibility for a Games Design and Development project, and to enhance the production and presentation of the Masters stage report and oral defence.	SC2	SCQF 11
LLO12	Critically analyse a complex games design or development problem, identifying key requirements, constraints, alternative solutions, and appropriate evaluation strategies.	SC3	SCQF 11, SCQF 11
LLO13	Create an original and effective design or technical solution that responds innovatively to a specific games development challenge.	SC3	SCQF 11
LLO14	Make informed decisions in situations where design, technical, or userexperience information is incomplete, ambiguous, or conflicting.	SC3	SCQF 11
LLO15	Evaluate the effectiveness, impact, and quality of proposed game design or technical implementation solutions using appropriate criteria and evidence.	SC3	SCQF 11
LLO16	Evaluate the selection and use of playtesting, usability testing, or technical validation strategies to ensure games or prototypes meet design intent and user requirements.	SC3	SCQF 11
LLO17	Produce a coherent and feasible proposal for the Masters project, including aims, methods, justification, scope, and evaluation plan.	SC3	SCQF 11
LLO18	Generate the Masters project by identifying project goals, evaluating multiple design or technical strategies, and producing a rigorous, welldeveloped final game or research artefact.	SC3	SCQF 11
LLO19	Communicate effectively using appropriate visual, written, and oral methods to convey design concepts, technical information, and research findings to audiences with varied levels of expertise.	SC4	SCQF 11, SCQF 11
	Produce structured and coherent written reports documenting game design processes, technical investigations, user research, or		

LLO20	implementation strategies.	SC4	SCQF 11
LLO21	Construct and document design decisions, development processes, testing strategies, and production workflows through all stages of a major games project using appropriate software tools.	SC4	SCQF 11
LLO22	Produce a clear and coherent Masters thesis documenting the research, development, evaluation, and final outcome of a major game design or development project.	SC4	SCQF 11
LLO23	Analyse and interpret a variety of qualitative and quantitative data, including gameplay metrics, usertesting insights, performance data, and design evaluation results.	SC4	SCQF 11
LLO24	Take responsibility for presenting and defending the Masters project to a live audience of peers and/or academics.	SC4	SCQF 11
LLO25	Prepare concise and relevant reviews of project work, contribute effectively to teambased development tasks, and work to scheduled milestones within a structured production pipeline.	SC4	SCQF 11
LLO26	Critically evaluate specialist topics in games design, development, or interactive media research.	SC5	SCQF 11
LLO27	Take responsibility for collaborative work within development teams, contributing effectively and assuming responsibility for shared project outcomes.	SC5	SCQF 11
LLO28	Demonstrate autonomy by independently managing creative and technical tasks, decisionmaking, and self directed project development.	SC5	SCQF 11
LLO29	Produce effective professional communication in written, oral, and visual formats appropriate to academic and industry contexts.	SC5	SCQF 11
LLO30	Integrate critical reflection into personal practice, recognising strengths, limitations, and areas for development within professional or creative roles.	SC5	SCQF 11
LLO31	Analyse project tasks to identify design or technical problems, propose solutions, and define appropriate evaluation criteria.	SC5	SCQF 11
LLO32	Respond constructively to feedback, learn from peers, and engage in collaborative problemsolving processes.	SC5	SCQF 11
LLO33	Manage time and workload flexibly and responsibly across iterative development cycles, adapting to changing project requirements.	SC5	SCQF 11
LLO34	Appraise ethical, social, cultural, accessibility, and professional issues associated with creating games, interactive experiences, and digital content.	SC5	SCQF 11
LLO35	Critically evaluate game design problems, development solutions, and alternative approaches within professional or research contexts.	SC5	SCQF 11

Programme Outcome Types Reference		
#	SCQF Characteristic	SCQF Level
SC1	Knowledge and understanding	SCQF 7 - SCQF 7 SCQF 8 - SCQF 8 SCQF 9 - SCQF 9 SCQF 10 - SCQF 10 SCQF 11 - SCQF 11 SCQF 12 - SCQF 12
